

Setup Guide — Plain English Edition

No tech experience needed. We'll take it one step at a time.

What is this guide?

This guide gets PrepBoi — your kitchen's checklist and training app — up and running. You will be setting up a few free online accounts and copying some information between them. Think of it like setting up a new email account, just a few more steps. If you follow each step in order, you'll have the app live in under an hour.

What You're Setting Up

Here's the big picture. You're connecting four services together. You don't need to understand how they work — just know what each one does:

Supabase — Your Database

This is where all your data lives: staff accounts, checklists, recipes, training content. Think of it as the filing cabinet behind the app. Free to start.

Resend — Email Sender

When a team member finishes a checklist, managers get an email. Resend is what sends those emails. Free for up to 3,000 emails per month.

Anthropic — The Quiz Brain

When you create a training SOP or add a recipe, the app can automatically generate a quiz for your staff. Anthropic powers that. Very cheap — a few cents per quiz generated.

Netlify — Your App's Home

This is where the app itself lives on the internet, so your team can open it on their phones. Free tier works great for most restaurants.

Before You Start

Create a free account at each of these websites. You can open them all in different browser tabs now and come back to this guide.

supabase.com

Sign up → Create a new organization when prompted

resend.com

Sign up → You'll add your email domain later in the guide

console.anthropic.com

Sign up → Add \$5 in credits (more than enough to start)

netlify.com

Sign up → Connect with your GitHub account if you have one

github.com

Sign up → This is where the app's code lives (free account is fine)

Set Up Your Database (Supabase)

This is the most important step. Your database is the heart of the app — everything gets stored here.

Create Your Project

1 Go to supabase.com and sign in

Once you're in, you'll see a dashboard. Click the big green "New project" button.

2 Fill in your project details

Name: call it something like "prepboi" or your restaurant name

Database password: make this strong — save it in your phone notes or a password manager

Region: pick the city closest to your restaurant (e.g. "US East" for the eastern US)

Then click "Create new project" and wait about a minute.

Set Up the App's Data Structure

The app comes with a setup file that creates all the tables and rules your database needs. You just need to paste it in.

3 Open the SQL Editor

In the left sidebar of your Supabase project, click "SQL Editor".
Then click "New query" at the top.

4 Open the setup file

On your computer, open the prepboi-prod folder.
Inside it, open the folder called "supabase", then "migrations".
Open the file called "001_schema.sql" with any text editor (Notepad on Windows, TextEdit on Mac).

5 Copy and paste

Select all the text in that file (Ctrl+A on Windows, Cmd+A on Mac).
Copy it (Ctrl+C / Cmd+C).
Click inside the SQL Editor box in your browser and paste (Ctrl+V / Cmd+V).
Click the green "Run" button.
You should see: "Success. No rows returned." That's good!

Something went red?

If you see a red error, the most common reason is the file was already run on this database.
If this is a brand new project, double-check that you copied the ENTIRE file from start to finish and try again.

Turn Off Email Confirmation

By default, Supabase wants every new staff member to click a confirmation link in their email.
For a kitchen app, this is a pain — let's turn it off.

6 Turn off email confirmations

In the left sidebar, click "Authentication".
Click "Settings" (or "Email" depending on the version).
Find the toggle that says "Enable email confirmations" and turn it OFF.
Click "Save".

Save Your Database Keys

These are like passwords that let the app talk to your database. You'll need them in Step 3.

7 Find your keys

In the left sidebar, click "Settings".

Click "API".

You'll see two things to copy:

- "Project URL" — it looks like: `https://abcdefgh.supabase.co`
- "anon public" key — a long string starting with "eyJ"

Copy both and paste them into a notes app or text file. Label them clearly.

Add Your Restaurant to the App

Now you'll tell the app your restaurant's name and your first location. This takes about 2 minutes.

1 Go back to the SQL Editor

In Supabase, click "SQL Editor" in the left sidebar, then "New query".

2 Add your restaurant

Copy this text, change "Your Restaurant Name" and "your-slug" to match your place:

```
INSERT INTO organizations (name, slug)
VALUES ('Your Restaurant Name', 'your-slug')
RETURNING id;
```

For example: ('Bake Tempe', 'bake-tempe')

Click Run. A box will appear with a long string of letters and numbers.

Copy that string — it's your Organization ID. Save it in your notes.

3 Add your first location

Paste this, swapping in your Organization ID and location info:

```
INSERT INTO locations (org_id, name, address, timezone)
VALUES ('<paste-org-id>', 'Mill Ave', '123 Mill Ave Tempe AZ', 'America/Phoenix')
```

RETURNING id;

Click Run. Copy the ID that comes back — this is your Location ID. Save it.

Have multiple locations?

Just run the INSERT INTO locations command again for each location, using the same org_id. Each gets its own Location ID.

Put the App on the Internet (Netlify)

This is how your team will access the app on their phones. We're putting it on a free hosting service called Netlify.

First — Put the Code on GitHub

GitHub is like a Google Drive for code. Netlify will grab the code from there.

1 Create a GitHub account if you don't have one

Go to github.com and sign up. A free account is all you need.

2 Create a new repository (a storage space for the code)

Once logged in, click the "+" button in the top right → "New repository".
Name it "prepboi" and keep it set to Private.
Click "Create repository".

3 Upload the code

On the next page, look for a link that says "uploading an existing file".
Drag your entire "prepboi-prod" folder's contents into the upload area.
Click "Commit changes" at the bottom.
Your code is now saved on GitHub.

Now — Connect Netlify to GitHub

4 Open Netlify and add your site

Go to app.netlify.com and sign in.
Click "Add new site" → "Import an existing project".
Click "GitHub" and authorize Netlify to see your repositories.
Choose your "prepboi" repository from the list.

5 Check the build settings

Build command should say: `npm ci && npm run build`
Publish directory should say: `dist`
These should be filled in automatically. If not, type them in.
DO NOT click Deploy yet — you need to add your keys first.

6 Add your app's keys (environment variables)

Click "Environment variables" on the left, or look for a section called "Environment variables" on the setup screen.

Add these four variables one by one:

VITE_SUPABASE_URL → paste your Project URL from Step 1
VITE_SUPABASE_ANON_KEY → paste your anon public key from Step 1
VITE_ANTHROPIC_API_KEY → your Anthropic key (get from console.anthropic.com/keys)
VITE_APP_URL → leave blank for now (you'll fill this in after deployment)

For the Anthropic key: go to console.anthropic.com → API Keys → Create Key. Copy it.

7 Deploy!

Click "Deploy site".
Netlify will build your app. This takes 2-3 minutes.
When it's done, you'll see a URL like: `amazing-cookie-abc123.netlify.app`
Copy that URL and go back to Netlify Environment Variables.
Add it as `VITE_APP_URL` and click Save.
Then click "Trigger deploy" → "Deploy site" one more time to pick up the URL.

Your app is live!

Open the URL on your phone. You should see the PrepBoi logo and a sign-in screen. You can't sign in yet — that's the next step.

Create Your Manager Account

Now you'll create your own account and give yourself full admin access. After this, you can create all other staff accounts through the app itself.

1 Sign in to the app for the first time

Open your Netlify URL on your phone or computer.
Type your work email address and a password (make it strong).
Click Sign In. The app will create your account.
You'll see the app but won't have admin access yet — that's fine.

2 Find your User ID

Go back to Supabase.
In the left sidebar, click "Authentication".
Click "Users".
Find your email in the list and click on it.
Copy the "User UID" — it's a long string like: abc12345-de67-...
Save it in your notes.

3 Give yourself admin access

Go to SQL Editor → New query.
Paste this, replacing the three placeholders with your actual IDs:

```
UPDATE profiles
SET
  role      = 'super_user',
  org_id    = '<your-org-id>',
  location_id = '<your-location-id>'
WHERE id = '<your-user-uid>;'
```

Click Run. It should say: "1 row affected."

4 Sign out and back in

In the app, tap your avatar in the top right to sign out.
Sign back in with the same email and password.
You should now see an "Admin" tab at the bottom. You're in!

Set Up Email Notifications (Resend)

When a staff member submits a checklist, you'll get notified in the app AND by email. This step sets up the email part.

1 Get your Resend API key

Go to resend.com and sign in.

Click "API Keys" in the left sidebar.

Click "Create API Key". Name it "prepboi".

Copy the key that appears — it starts with "re_".

IMPORTANT: This key only shows once. Save it now.

2 Install a small helper tool on your computer

Open a Terminal (Mac: press Cmd+Space, type "Terminal") or Command Prompt (Windows: press Windows key, type "cmd").

Type this and press Enter:

```
npm install -g supabase
```

Then type:

```
supabase login
```

It will open a browser window asking you to confirm. Click Authorize.

3 Connect to your Supabase project

Find your Project Reference ID: in Supabase → Settings → General → look for "Reference ID" (looks like: abcdefghijk)

In your terminal, type:

```
supabase link --project-ref <paste-your-ref-here>
```

Press Enter.

4 Add your email secrets

In the terminal, type these three commands one at a time (press Enter after each):

```
supabase secrets set RESEND_API_KEY=re_paste_your_key_here
```

```
supabase secrets set FROM_EMAIL=noreply@yourdomain.com
```

```
supabase secrets set APP_URL=https://your-netlify-url.netlify.app
```

Replace each placeholder with your actual values.

5 Deploy the email function

Still in the terminal, type:

supabase functions deploy notify-email

Press Enter and wait about 30 seconds.

Copy the URL it shows at the end — it looks like:

<https://abcdefghijklm.supabase.co/functions/v1/notify-email>

6 Wire the email trigger

In Supabase, click "Database" in the left sidebar.

Click "Webhooks".

Click "Create a new hook".

Fill in:

Name: notify-email

Table: notifications

Events: check INSERT only

Type: HTTP Request

URL: paste the function URL from the step above

Under Headers, add: Authorization = Bearer <your anon key from Step 1>

Click "Create webhook".

Emails are live!

Try it: complete a checklist as a staff member and a notification email should arrive in your inbox within 30 seconds.

Add Your Team

Now the fun part — adding your staff. You don't need SQL for this. Everything happens inside the app's Admin panel.

1 Open the Admin panel

Open the app on your phone or computer.

Tap the "Admin" tab at the bottom.

Tap "Users".

2 Add each team member

Tap "+ Add User".

Enter their full name, work email, and a temporary password.

Choose their role:

Employee → regular kitchen staff

Shift Leader → gets notifications, can see submission dashboard, can assign training

Super User → full access, same as you

Choose their location from the dropdown.

Tap "Create Account".

They can now sign in at your app URL with that email and temporary password.

Password tip

Set everyone's temporary password to something simple like their first name + 1234. Tell them to change it once they're in — they can update their profile in the app.

Create Your First Checklist

Let's make your first opening or closing checklist so your team has something to work with on day one.

1 Go to Checklists in Admin

In the Admin panel, tap "Checklists".

Tap "+ New Checklist".

2 Fill in the basics

Emoji: pick one that matches (for AM, for PM)

Title: something like "AM Opening Checklist"

Category: opening, closing, safety, or general

Shift: AM, PM, MID, or ALL

Due Time: when it should be completed by (e.g. 07:00)

Est. Minutes: how long it takes to do

3 Add your sections and items

A checklist is organized into sections (like "Before Open", "During Service").

Each section has items (individual tasks to check off).

Tap "+ Add Section" to create a section, give it a title.

Tap "+ Add Item" under that section to add tasks.

For each item, check "Required" if it must be done before submitting.

If an item needs a note or a temperature reading, pick it from the "Trigger" dropdown.

4 Save it

Tap "Save Checklist ✓".

It's immediately visible to the roles you assigned it to.

Open the app as an employee account to see it in action.

You're Done!

Seriously — that's everything. Your app is live, your team is in, and your first checklist is ready. Here's a quick reminder of what everyone can do:

Role	What They Can Do
Employee	Complete checklists, read training SOPs, take quizzes, view and scale recipes
Shift Leader	Everything above, plus: see the live submission dashboard, assign training to staff, get notified when checklists are submitted
Super User	Everything above, plus: create and edit checklists, SOPs, recipes, manage all user accounts, upload PDF recipes

Something Not Working?

Can't sign in

Double-check the email and password. If email confirmation is on, turn it off in Supabase → Authentication → Settings. Make sure the profile has an org_id set (Step 2).

No email notifications arriving

Check that you completed Step 5 fully. In Supabase → Edge Functions → notify-email → Logs, you'll see any error messages. Also check your spam folder.

Admin tab not showing

Your account's role needs to be super_user. Go back to Step 4, Step 3 and run the

SQL UPDATE again.

App looks broken or won't load

Clear your browser cache (Ctrl+Shift+Delete / Cmd+Shift+Delete) and reload. If it still won't load, check that all four environment variables are set in Netlify and trigger a new deploy.

Quizzes not generating

Check that VITE_ANTHROPIC_API_KEY is set correctly in Netlify. Make sure your Anthropic account has credits (even \$1 is plenty to start).

prep**boi** — You built this. Nice work.
